

## PEGASUS

### Mobile Phone and Online Tracking System

BARTEC's new mobile phone PEGASUS for use in hazardous areas has been especially designed for the use in rough industrial environments. The high protection type IP 65 and the use at ambient temperatures between -20°C and 60°C enables the user to work even under extreme ambient conditions.

The keyboard has been designed so that it can easily be used even with gloves. All keys as well as the alphanumeric keys have a tactile feedback. The OLED full colour display can easily be read even under poor light conditions. A highly efficient rechargeable Li-polymer battery makes sure there is enough capacity.

The integrated loudspeaker offers the user a comfortable hands-free speaking function during activities where both hands are needed. Besides, PEGASUS has a vibration function so that no call is missed even in noisy environments. In addition to the phone function, text messages can be sent and received.

PEGASUS is equipped with a quadband GSM module (850/900/1800/1900 MHz) and is available in different models. It is the optimal mobile phone for every region and every field of application.

The Ex mobile phone has an optional man down sensor and due to the integrated GPS receiver and the sophisticated software, PEGASUS can also be used for professional online tracking.
